ELECTRON.JS WORKSHOP

Setup & Prerequisites

A preparation guide covering the development environment, required software, accounts, tools, and system configuration required before beginning the Electron.js Workshop.

Contents

01	Visual Studio Code Setup	01
02	Node.js Setup	03
03	Setup Verification	07

SECTION 01

System Requirements

Minimum hardware, operating system, software, and connectivity requirements for the Electron.js Workshop.

1. Setup Verification

After completing the installation process, verify that the required development tools are correctly installed and accessible from the system terminal.

The following checks should be completed before beginning the Electron.js Workshop.

1.1 Verify Visual Studio Code

Open Command Prompt, PowerShell, Terminal, or the Visual Studio Code integrated terminal and run:

```
code --version
```

A Visual Studio Code version number should be displayed.

1.2 Verify Node.js

Run:

```
node --version
```

A Node.js version number should be displayed.

1.3 Verify npm

Run:

```
npm --version
```

An npm version number should be displayed.

1.4 Verify Electron.js

Navigate to the Electron.js project directory and run:

```
npx electron --version
```

If Electron.js is installed correctly within the project, the installed Electron version will be displayed.

1.5 Final Verification

The following commands can be executed individually to confirm the complete development environment:

```
code --version  
node --version  
npm --version  
npx electron --version
```

All commands should return valid version information without installation or command-not-found errors.

1.6 Setup Checklist

Before attending the workshop, confirm that:

- ☐ Visual Studio Code is installed and opens correctly.
- ☐ Node.js is installed.
- ☐ npm is available from the terminal.
- ☐ Electron.js is installed in the workshop project.
- ☐ The Electron.js version command executes successfully.
- ☐ A stable internet connection is available.

Environment Ready

If all verification checks are successful, the development environment is ready for the Electron.js Workshop.

SECTION 02

Visual Studio Code Setup

Installation and configuration of Visual Studio Code on Windows and macOS.

2. Visual Studio Code Setup

Visual Studio Code (VS Code) will be used as the primary code editor throughout the Electron.js Workshop. It provides an integrated terminal, extension support, source control, and a suitable development environment for JavaScript, Node.js, and Electron.js.

2.1 Download

Download Visual Studio Code from the official website:

<https://code.visualstudio.com/>

Choose the installer appropriate for your operating system.

2.2 Windows Installation

Download the Windows installer from the official Visual Studio Code website and launch the setup file.

During installation, accept the license agreement and continue with the default installation path. On the **Select Additional Tasks** screen, enable the following options:

- Add “Open with Code” to the file context menu
- Add “Open with Code” to the directory context menu
- Register Visual Studio Code as an editor for supported file types
- Add Visual Studio Code to PATH

Complete the installation and launch Visual Studio Code.

2.2.1 Verification

Open Command Prompt, PowerShell, or the VS Code integrated terminal and run:

```
code --version
```

If the installation is configured correctly, the installed Visual Studio Code version will be displayed.

Windows Setup Complete: Visual Studio Code is installed and ready for use.

2.3 macOS Installation

Download the appropriate macOS version of Visual Studio Code from the official website. Select the Apple Silicon version for supported Apple Silicon systems, or the Intel version where required.

Open the downloaded file and move **Visual Studio Code** to the **Applications** folder. Launch the application from:

Applications → Visual Studio Code

If macOS displays a security confirmation, select **Open**.

2.3.1 Enable the code Command

To use Visual Studio Code directly from Terminal, open VS Code and press:

```
Command + Shift + P
```

Search for and select:

```
Shell Command: Install 'code' command in PATH
```

Close and reopen Terminal after completing this step.

2.3.2 Verification

Open Terminal and run:

```
code --version
```

The installed Visual Studio Code version should be displayed.

You can also open the current working directory directly in VS Code using:

```
code .
```

macOS Setup Complete: Visual Studio Code is installed and ready for use.

SECTION 03

Node.js Setup

Installation and verification of Node.js and npm on Windows and macOS.

3. Node.js Setup

Node.js provides the JavaScript runtime required for the development environment used throughout the Electron.js Workshop. Installing Node.js also installs the Node Package Manager (**npm**), which will be used to install and manage project dependencies.

For this workshop, participants should install the current **Long-Term Support (LTS)** version of Node.js.

3.1 Download

Download Node.js from the official website:

<https://nodejs.org/>

Select the **LTS** version appropriate for your operating system.

3.2 Windows Installation

Download the Windows installer from the official Node.js website and launch the setup file.

Proceed through the installation using the default configuration. The installer will configure Node.js and npm and add the required commands to the system PATH.

Keep the standard installation options enabled and complete the setup.

After installation, close any previously opened terminals and open a new **Command Prompt**, **PowerShell**, or VS Code terminal.

3.2.1 Verify Node.js

Run:

```
node --version
```

A Node.js version number should be displayed.

3.2.2 Verify npm

Run:

```
npm --version
```

A corresponding npm version number should be displayed.

Windows Setup Complete: Node.js and npm are installed and available from the terminal.

3.3 macOS Installation

Download the macOS installer from the official Node.js website.

Select the installer appropriate for your Mac and install the **LTS** version of Node.js.

Open the downloaded installer and proceed through the standard installation process. Node.js and npm will be installed together.

After installation, close any previously opened Terminal windows and open a new Terminal.

3.3.1 Verify Node.js

Run:

```
node --version
```

The installed Node.js version should be displayed.

3.3.2 Verify npm

Run:

```
npm --version
```

The installed npm version should be displayed.

macOS Setup Complete: Node.js and npm are installed and available from Terminal.

3.4 Installation Check

Regardless of the operating system, both commands should execute successfully:

```
node --version  
npm --version
```

If both commands return version numbers, the Node.js development environment is ready for the next stage of the workshop.
